Project Description

Olist E-Commerce Analytics

DEPI Professional Data Analytics Capstone

This project analyzes the Olist Brazilian e-commerce dataset, which contains about 100,000 orders placed between 2016 and 2018 across 8 related tables: orders, order items, payments, reviews, customers, sellers, products and category translations.

The team profiles and cleans the data using Python and SQL, builds a SQL Server data model with defined keys and relationships, and documents every step in a data dictionary. The cleaned data is then used to build a Power BI dashboard that answers business questions about sales, delivery performance and customer satisfaction.
